

Five Easy Stages

Stage 1: Head (Issues 1-8)

In the first phase of the build you will assemble the main structure of Robi's head. During this stage, you will receive a temporary stand on which to mount Robi's neck and test the movement of his head.

Stage 2: Arms (Issues 9-20)

Next, you assemble Robi's arms and the internal servos that control their complex movements.

Stage 3: Legs (Issues 21-45)

Now assemble the left and right legs, then add the main control board and battery so you can test the servo operation.

Stage 4: Body (Issues 46-55)

Link the mechanical components together and complete Robi's body, ready to install the final elements that give him his 'intelligence'.

Stage 5: Completion (Issues 56-70)

Mount the speech-recognition board, remote control, motion sensors, and other key control systems. Carry on to add the finishing touches and adjust Robi's settings, ready to bring him to life.
